SCITT HTML PRACTICE EXERCISE

- Create a new repo for this project on GitHub.com

and call it `scitt-recipes` and choose the `public` option instead of the default private.

- Clone that repository onto your local machine, The command should look like `git clone https://github.com:username/scitt-recipes.git` (use HTTPS).

- Now `cd` into the `scitt-recipes` project directory that is now on your local machine.

- Open your IDE

On your IDE

1. Within the `scitt-recipes` directory, create an `index.html` file.
2. Fill it out with the usual boilerplate HTML and add an `h1` heading "SCITT Recipes" to the body. - You can use the name of your favourite dish or, if you need some inspiration, you can find a recipe to use on Google.

Your new recipe page should have the following content:

3. An image of the finished dish under the h1 heading that you added earlier. You can find images of the dish on Google
4. Under the image, it should have an appropriately sized "**Description**" heading followed by a paragraph or two describing the recipe.
5. Under the description, add an "**Ingredients**" heading followed by an **unordered list** of the ingredients needed for the recipe.
6. Finally, under the ingredients list, add a "**Steps**" heading followed by an **ordered list** of the steps needed for making the dish.

NB: The website won't look very pretty by the time you've finished but it's important to keep in mind that this project is just to build your HTML skills; we will revisit this project in the future to make it bigger and also style it up with CSS.
